Abstract

The kinetics and mechanism of the effect of various positions of methyl substituent in aromatic ring were studied by oxidizing o,m and p methyl substituted phenoxy acetic acid hydrazides to their corresponding aryloxy acetic acids by vanadium (v) in sulphuric acid medium under pseudo first order condition. The formation of complex between the reactants decomposes in the subsequent step to give products. The reaction proceeds by one electron transfer with intervention of free radical. Increase in hydrazide concentration decreases the specific rate. Increase in acid concentration increases the reaction rate and decreases with decrease in dielectric constant.

The effect of temperature was studied between 25 to 55 °C. The activation parameters were determined and the values support the proposed mechanism as evidenced by considerable decrease in entropy of activation ($-\Delta S^\ddagger = 141.68, 135.78$ and $134.86 \text{ J K}^{-1} \text{ mol}^{-1}$ respective for o-Me-PAAH, m-Me-PAAH and p-Me-PAAH respectively).

Keywords: Oxidation, Kinetics, mechanism, pseudo-first order, hydrazides, vanadium (V), o-Me-PAAH, m-Me-PAAH, p-Me-PAAH.

Introduction

Oxidation is an important transformation in organic chemistry. Hydrazides are derivatives of carboxylic acids with hydrazines⁹. They have been extensively used in various fields of chemistry^{3,6,10,12,21-23} for the preparation of variety biologically important molecules, therefore it is necessary to study and understand the mechanism of their oxidation by using Chemical kinetics which deals with the rate at which the chemical reactions take place and deals with the influence of various factors such as effect of position of same substituent's in aromatic ring, concentration of reactant, temperature, pressure catalysts etc. on the rates of the reaction.

Material and Methods

The preparation of the o-Me-PAAH, m-Me-PAAH and p-Me-PAAH was done by reported procedure²⁰ and stored in amber colored bottles kept in dark place. Ammonium

metavanadate, sulphuric acid and salt used were of AR grade. The stock solution of ammonium metavanadate was prepared by dissolving calculated quantity of ammonium metavanadate in hot double distilled water. The vanadium (V) solution was standardized against standard ferrous ammonium sulphate solution by using diphenylamine. Similarly the stock solution of sodium perchlorate was prepared by dissolving equivalent quantities of sodium carbonate and perchloric acid (70% E. Merck) in water to maintain ionic strength. Standard solutions of o-Me-PAAH, m-Me-PAAH and p-Me-PAAH were prepared by dissolving corresponding hydrazide in ethanol-water (60% + 40%) system. The double distilled water was used throughout the experiment.

The pseudo-first order condition was maintained through the reaction in which concentration of hydrazide was in excess as compared to that of ammonium metavanadate. The formation of complex between vanadium (V) and hydrazide was found during the course of the reaction. The plot of the log of absorbance at 390 against time for each hydrazide was used to calculate the pseudo-first order rate constant k found to be fairly constant at different concentrations of vanadium (V). The UV-VIS. Spectrophotometer ELICO-(INDIA) S.L.159 was used to measure the absorbance of the reaction mixture at 390 spectrophotometrically.

Results and Discussion

Effect of Concentration of Reactant: The formation of complex between vanadium (V) and hydrazide (Fig. 1) takes place during the course of the reaction. The specific rate of oxidation is independent of concentration of oxidant (Table 2) and hydrazide (Table 3). The order is unity with oxidant concentration. The specific rate of oxidation decreases with increase in concentration of hydrazide. The decrease in rate constant as the concentration of hydrazide increases can be attributed to greater stability of the complex in alcoholic medium probably due to solvation¹⁶. This is evident from initial absorbance values of the complex with different hydrazide concentrations.

Effect of Sulphuric Acid Concentration: As the concentration of acid increases, the specific reaction rate increases. This effect of sulphuric acid on the reaction may be due to the protonation prior equilibria. Oxidant vanadium (V) was reported to undergo variety of protonation reactions² and

under the present experimental conditions protonated vanadate might be considered as a predominant species as shown by equilibrium (1):

The substrate, hydrazide is also known to undergo protonation¹⁹ according to equilibrium (2):

The protonation constants of both the oxidant and substrate, K_1 and K_2 , are very high, thus converting both the reactants almost completely into their protonated forms in the hydrogen ion concentration range used in the present study (5.0×10^{-1} M to 5.0×10^{-2} M). Therefore, both the protonated forms of the reactants may be active in the present investigation. The graph of $\log k$ vs $\log [\text{Acid}]$ is linear and the order of reaction is found to be fractional (Fig. 2).

Effect of Ionic Strength, Dielectric Constant and Temperature: To study the effect of ionic strength, the concentration of sodium perchlorate in the reaction mixture was varied from 0.3×10^{-1} to 3.0×10^{-1} M. The evidence shows that increase in ionic strength has no influence on the rate of the reaction.

Various percentages of aqueous ethanol were used to investigate the effect of dielectric constant on specific rate of reaction which decreased with decrease in dielectric constant. The graphs of $\log k$ vs $1/\text{Dielectric Constant}$ are plotted which are linear (Fig.3). Such decrease in rate with decrease in dielectric constant is reported¹¹.

The different temperatures ranges from 25° to 55°C were used to study the kinetics of oxidation of hydrazides. The $\log (\text{Abs})$ against time plotted at different temperatures was found to be linear which reveals that the Pseudo-first order kinetic behavior of the reaction is not affected by change in temperature. The values of observed rate constants were used to determine various thermodynamic parameters like temperature coefficient, energy of activation (E_a), enthalpy of activation (ΔH^\ddagger), entropy of activation (ΔS^\ddagger) and free energy of activation (ΔG^\ddagger) (Table 1).

Reaction Intermediate, Stoichiometry and Product Analysis: It is already seen that the order of the reaction with respect to vanadium (V) is one. The first order dependence of reaction rate on concentration of vanadium (V) itself indicates the possibility of formation of free radicals during the course of the reaction. The formation of free radicals or radical ions during the course of reaction was confirmed from induced polymerization of acrylonitrile⁸. The mole ratio of hydrazide: vanadium (V) is found to be 1:4 and it is independent of concentration of sulphuric acid that was used. The integral value of observed mole ratio, its independence on sulphuric acid concentration and formation of only carboxylic acid along with nitrogen gas, as oxidation product leads to deduce that the two rate determining steps occurring simultaneously result in the formation of one and the same intermediate. Although the observed mole ratio (substrate: oxidant) of the reaction is 1:4, as pointed out earlier, the order of reaction with respect to vanadium (V) is one. This fact makes it clear that three moles of vanadium (V) are consumed in fast step(s) taking place after rate determining step(s). Oxidation products identified in these reactions are given in scheme 1.

Scheme 1

Besides the formation of corresponding aryloxy acetic acids, the nitrogen gas is also evolved in each reaction. The formation of carboxylic acids and N₂ in the oxidation of aliphatic as well as aromatic acid hydrazides⁷ is well documented in chemical literature. The study of oxidation of hydrazide by different oxidants indicated that the formation of ammonia also takes place in addition to the formation of respective aryl oxy acetic acid and nitrogen^{4,17}.

The object of present study is to examine the effect of substituent's on the reaction rate. Hence it is essential to review the various mechanistic criteria usually employed in the determination of reaction mechanism and to suggest plausible mechanism on the basis of experimental facts. The mechanism in terms of the active species of the oxidant HVO₃ and substrate protonated hydrazide is shown in the scheme 2.

According to the above scheme the rate of the reaction is given by:

$$\text{Rate} = k_c [\text{Complex}]$$

Substituting the value of [Complex] from the equilibrium,

$$\text{Rate} = k_c K_c [\text{HVO}_3] [\text{Ar-CO-NHNH}_3^+]$$

Conclusion

Relative reactivities of hydrazides: The objective of the present investigation is not only to develop method for the oxidation of hydrazides to their corresponding acids but to

study the effect of position of same substituent in aromatic ring on the rate of reaction as well as mechanism.

The order of reactivities of the hydrazides under investigation is:

In case of o-Me-PAAH the methyl group is nearer to reaction site and being more bulky and due to steric hindrance weak electron donating inductive effect might be operating which has negligible effect on its reactivity¹⁴. Alkyl groups were formerly regarded as electron donating

but many examples of behavior have been found that can be interrupted only by the conclusion that alkyl groups are electron withdrawing as compared to hydrogen.¹³

The slight increase in reaction rate in case of m-Me-PAAH and p-Me-PAAH is due to electron withdrawing inductive effect¹⁴ of methyl group in comparison with hydrogen which can be attributed to similar observations

comparatively as the reaction centre is away so the reaction rates are nearly constant.

Aim and Scope

We invite you to contribute Research Papers / Short Communications / Review Papers:

- in any field of **Chemical Sciences, Environmental Sciences, Agricultural Sciences, Soil Sciences, Bio Sciences, Pharmaceutical Sciences, Chemical Engineering, Civil Engineering and Environmental Engineering.**
- in any field related to **Chemistry (Inorganic / Organic / Physical / Analytical / Instrumental / Biochemical / Pharmaceutical / Industrial Chemistry).**
- in any field related to **Chemicals and Industries including Plastics / Drugs / Pesticides / Polymers / Textiles / Dyes / Papers / Steel / Metals / Foods/ Paints / Rubber / Fertilizers / Leather / Cement / Sugar / Distilleries / Explosives / Oils / Petroleum / Petrochemical / Fragrances etc.**
- in any field related to **Environment, Energy, Power, Pollution (Air, Water and Noise Pollution) in Industries, Land, Cities, Rivers, Lakes etc.**
- in inter-related fields of **Chemistry, Chemical Industries and Pollution.**

Invitation

We welcome your submission to our blind peer reviewed, international monthly journal "Research Journal of Chemistry and Environment" (E-ISSN No. 2278-4527; PRINT-ISSN No. 0972-0626) in field of Chemical Sciences, Environmental Sciences, Chemical Engineering, Civil Engineering, Pharmaceutical Sciences etc. Our journal has been published regularly from year 1997. The journal had **SCI impact factor of 0.636 for year 2012** assessed from January 2012 to December 2012. Impact factor for year 2011 was 0.379; for year 2010 it was 0.292 and for year 2009 it was 0.323. Our journal is under re-evaluation of SCI in year 2017. [We do not charge any kind of fees (open access contribution charge, submission charge, author charge, per page charge, publication charge, processing charge, colour page charge etc.) for submission, acceptance and publication of manuscript for any of our journals].

Our journal is indexed and abstracted in:

**SCOPUS
Chemical Abstracts**

Our journal is included in **UGC list** so that Indian authors can publish their manuscripts with us for API scores and for promotion in the careers.

Submissions are sent to two experts for review and if both the experts approve, then we accept the paper for publication. We are continually improving the journal, with the goal of having one of the ten best international scientific journals in the world. Therefore, we are presently in search of a good team of editors, associate editors, co-editors, regional editors, subject editors and conference editors throughout the world. Our interdisciplinary journal publishes only the most cutting-edge research, with the goal of connecting scientists to develop various research projects in consultation with a variety of industry partners for the benefit of mankind.

You are welcome to upload the papers online at website www.worldresearchersassociations.com at menu "paper submission". Questions may be addressed via email to info@worldresearchersassociations.com
